

# Personal Development Plan

Mark Basting

## Step 1:

### Strong points

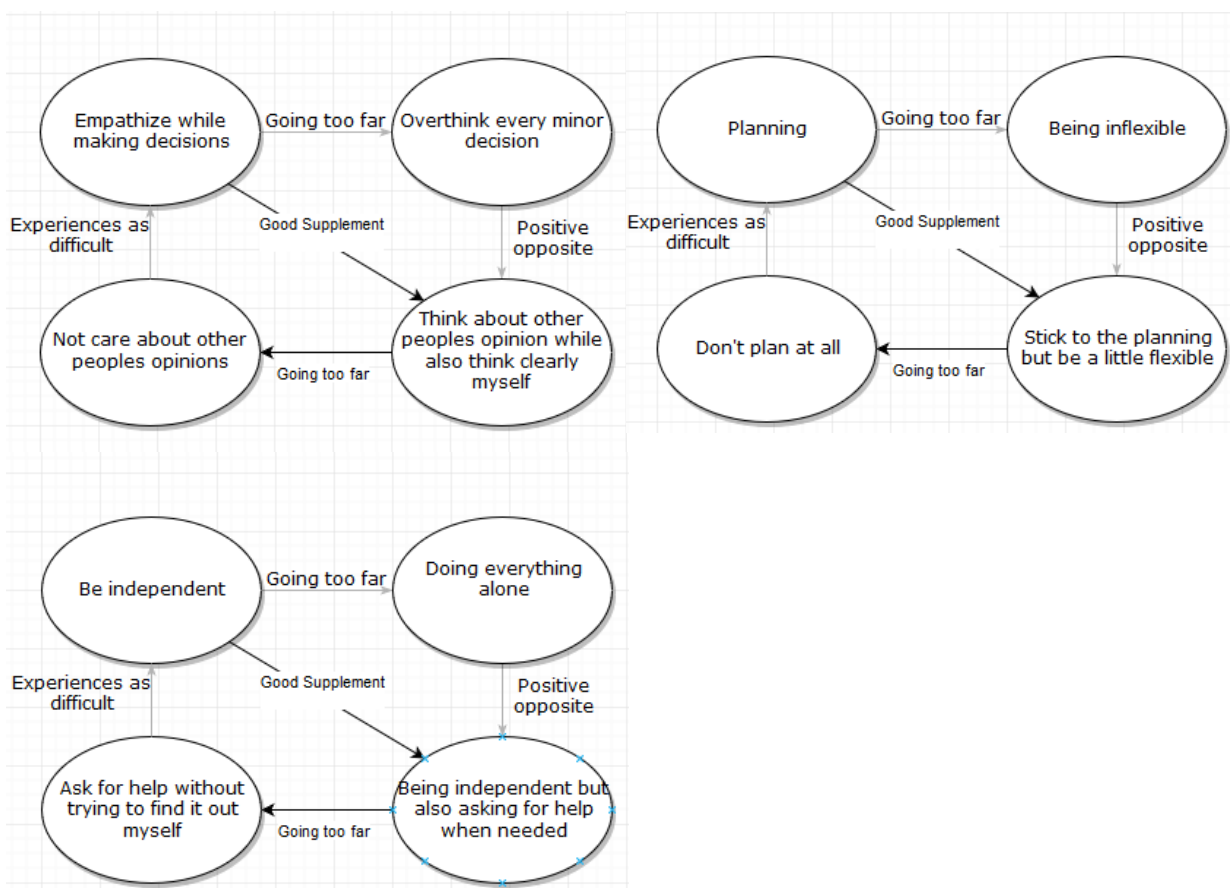

My two strong points are that, when I have to decide, I can see things from multiple viewpoints. Before I make a decision, I will first look at from multiple viewpoints and then carefully making the decision.

And I see myself as I good planner. This will help the team working more structured, and therefore we, as a team, will be more productive.

### Weak points

I tend to overthink decisions and see obstacle bigger as they are. So that means that I tend to procrastinate when I have to do things, because I think it is to much work or I can't do it.

And whenever I am stuck or need help, my pride tends to be to high and I don't ask them for help. This also leads to a lower level of productivity.

## Step 2:

### Goal

My goal for this project is to improve my knowledge and experience about programming in general and in a group. Because I am not that experienced with programming and this will later help me in my study. I will have achieved this goal when we finished the project and I understand and am able to implement it myself.

### Reality

I am currently not working on reaching my goal because I set my priorities elsewhere. But the other subjects which are my priority tend to go well. Something I could improve is that I should stick more to my planning even though I don't particularly want to do it.

### Options

My options for achieving this goal are to practise a lot and ask other people for help whenever I am stuck. But first try doing it myself, that is the main option. I just have to talk myself into starting and trying and have more faith in my capabilities. I overthink too much and therefore don't start with things/ projects because I think it is too much work or that I am not able to it.

### Will

I am going to have more faith in my own capabilities and try to not overthink too much. I will achieve this by sticking more to my planning and by just trying to do the task I am supposed to do.

My plan is to start doing this when we really start the project. But I can already make the start of a planning, find some things to help me achieve my goal and start programming more in my free time to already improve my experience.

My teammates can assist me whenever I am really stuck and explain their code if I don't understand what they have done.

My action plan would be making a planning every week and try to keep to my planning while still being flexible. And if I get stuck, ask for help/ advice from my teammates.
